

Decision Making and Problem Solving

The core framework

- **Define the problem - Are we solving the right problem?**

Use the problem funnel:

- Situation: What is happening?
- Impact: Who/ what is affected?
- Core Problem: What is broken? (Use 05 Whys)
- Constraints: What cannot change?
- Success Criteria: What does good look like?

Key Insight: Clarity before action. Don't jump to solutions

- **Generate options - From problem clarity to possibilities**

Use divergent thinking:

- Generate multiple ideas before selecting one
- Focus on range, not perfection

Techniques:

- Brainwriting
- Brainstorming

Key Insight: Better problem clarity leads to better ideas

- **Take the decision - From many options to one call**

Use decision filters:

- Does it solve the core problem?
- Does it meet success criteria?
- Is the impact worth the effort?
- Can it work within constraints?
- What are the risks and trade-offs?

Key Insight: Good decisions are not perfect; they are well-reasoned and owned

- **Review and improve - Every decision is a learning loop**

Use After Action Review (AAR):

- What worked well?
- What did not work as expected?
- What will we do differently next time?

Measure impact:

- Define KPIs
- Track outcomes vs expectations
- Key Insight: Revisit the problem, not just the solution
